DISCUSSION OF THE TAPE FORMAT

This document describes the format for computer compatible tapes (CCT) containing Thematic Mapper Archival Data (CCT-LASLIB-AT, abbreviated in this document as AT) and Product Data (CCT-LASLIB-PT, abbreviated in this document as PT) generated by the Landsat-D Assessment System (LAS). The generic name of this format, LAS CCT, is used interchangeably with LASLIB CCT. These data tapes are engineering products developed primarily for LAS internal use to assist in the early evaluation of Thematic Mapper data quality and ground data processing algorithms during the limited period of one year following the launch of Landsat-D. The data result from the application of engineering level software developed specifically to provide early access to Thematic Mapper results prior to the completion of the Landsat-D ground segment operational software. These tapes are provided to the EROS Data Center through the Landsat-D Project Science Office for subsequent distribution as defined under the Freedom of Information Act. Requests for specific data tapes should be directed to the EROS Data Center.

In these LAS-CCT tape volumes, LAS data files have been packaged within superstructure files and superstructure records in the manner recommended by the Landsat Ground Station Operators Working Group (LGSOWG) (Ref. 1).

The computer compatible tapes contain image data in band sequential format (BSQ) which means that a separate file is used for each sensor band. Each image file is preceded by a label file containing standard LAS descriptive label information. The number and sequence of files are identical for both AT and PT data. However, the larger size of PT images requires the use of three tapes while AT files are written on two tapes.

The allocation of the data files on the tape reels is illustrated in Figures 1 and 2. To insure proper LGSOWG form, each reel begins with a volume directory file. The last file of the last reel is a special directory containing parameter values indicating that no additional files follow. A

single Header, Ancillary, Annotation, and Header (HAAT) file precedes the image files. Each data file is preceded by a copy of the label file that is maintained internally by LAS. Several of the important parameters of the label are redundant with parameters in the LGSOWG superstructure records. In such cases, the parameters are copied so that the data may be processed by LGSOWG or LAS software. The image files have been arranged on the tapes in Band Sequential Order.

The A-level images are rectangular and contain 5792 image lines of 6176 1-byte pixels. Each line is extended with 480 unused bytes to a total length of 6656 bytes. This extension improves internal hardware efficiency on the LAS VAX computer. The values of the unused bytes are undefined.

The P-level images have been projected onto a coordinate frame that is fixed on the Earth's surface. As a result, rotation of the Earth beneath the spacecraft skews the acquired image into a parallelogram in ground coordinates. The standard LAS production software introduces variable amounts of left and right fill on each image line so that the standard P-level image is stored as a rectangular array. This fill scheme is illustrated in Figure 3. Each measured line is extended to a standard length of 6967 1-byte pixels using zero fill. In addition, the line is stored in a record whose length is a multiple of 512, in this case 7168 bytes. The values of the unused bytes are not defined. The P-level image contains 5965 lines.

All of the data values contained in the tapes are written in a form suitable to a VAX computer with one exception - the first field of each LGSOWG superstructure record is written in the byte order required by LGSOWG. Where arrays are used, the order in which array elements are stored is FORTRAN-like; that is, the first array index varies most rapidly.

The tapes produced by LAS are 2400-foot reels of magnetic tape recorded at a density of 6250 bpi using 9-track GCR technique. The magnetic tape is unlabelled. The tape reels themselves have printed identification for the volume and the Landsat-D Scene ID. The production program for LAS-CCT writes physical tape records that contain 4 image lines. This blocking factor of 4 reduces space lost to gaps between tape records.

This document describes the format in comprehensive detail through the use of a hierarchical arrangement of tables. The top level tables provide an overview of the structure, yet particular aspects of the tape data may be followed to any level of detail from volume organization down to the individual byte fields. The levels of organization required by the tape format are the following:

Volume Group: The set of tapes necessary to contain the information for a full TM Scene. This group is a Logical Volume as defined by LGSOWG; however, LGSOWG allows more complex file arrangements than those used for LAS-CCT. In LAS, there is only one scene per volume group.

Logical Volume: a term defined by LGSOWG (Ref. 1) to mean a related group of files occupying one or more physical tape volumes.

Physical Volume: A reel of magnetic tape. Each reel begins with a LGSOWG volume descriptor file. The descriptors on each reel are basically identical except for a field which notes where this physical volume is situated in the file sequence of the logical volume.

File: A block of related information bounded by tape marks (end of file marks). LGSOWG requires each file to be prefaced with a file descriptor record.

Record: A sequence of bytes recorded on tape and bounded by interrecord gaps. An LAS-CCT file consists of a sequence of records.

Field: A sequence of bytes that form part of a record. Both alphanumeric (ASCII) and binary numerical fields are used in LAS-CCT format. ASCII files are left justified.

The LAS-CCT format does not utilize the variability allowed by the LGSOWG standard. The records within a file are all the same length. Furthermore, the LAS-CCT does not use the variable segment option of the

LGSOWG file descriptors. In practice, this means that the scene identification must be read from the fixed location on tape as defined in this document, or it may be found on the printed document for the tape.

Evaluation of the early results from Landsat-D may motivate further additions or modifications to this document. In this case, revised pages for the document will be distributed with a cover letter giving the date on which the change becomes effective for the data product and listing the dates of all previous changes.

Table

Record	Ref.	Description
1	13b	LGSOWG File Description Record
2...	-	Image line blocks. Physical tape records containing an integral number of image lines.
...(NR+1)		The number of records is stored in Table 2 Record 1 and Record 1 of this file.

Record Size: There are 4 lines per record. Each line is filled to an even multiple of 512. For A-data, the lines are 6176 pixels filled to 6656 bytes. For P-data, the lines are 6967 pixels filled to 7168 bytes. Note that there are fewer than 6967 measured pixels on a P-image line because left and right zero fill is used to rectangularize the image.

Number of Records: $NR = 1 + (NL - 1)/4$;

Where NL = number of image lines.

For AT data, NL is 5792. For PT data, it is 5965.

Thus for AT data, there are 1448 records of 26624 bytes each; while for PT data, there are 1492 records of 28672 bytes each.

CONTENTS OF LGSOWG VOLUME DESCRIPTOR RECORD

Source of Information: Follows Ref. 1 exactly with variable parameters set for this application.

Bytes	Format	Description
1-4	RI	Contains the value 1 to indicate first record.
5	B	Contains a record code of octal 300
6	B	Contains a type code of octal 300
7	B	Contains a subtype code of 077 octal
8	B	Contains a subsubtype code of 022 octal
9-12	RI	Contains length of this record, 360 decimal.
13-16	A4	Contains 'A' indicating ASCII character set.
17-28	A12	Contains the document reference 'CCB-CCT-0002'
29-30	A2	Contains the document version ' C'
31-32	A2	Contains revision letter of superstructure records. the value ' ' is coded.
33-44	A12	Version of the LAS software. Initially, 'LAS V 1.0' is coded
45-60	A16	Identification of the physical reel of tape on which record is found.
61-76	A16*	Identification of the LGSOWG logical volume. For this application, the scrounge Scene-ID is coded.
77-92	A16	Identification of group as written on the tapes. Field 61-76 is repeated.
93-94	I2	Number of reels per group. For AT data, there are 2 reels and 3 for PT data.
95-96	I2	Sequence number of first volume. Always 1 for LAS.
97-98	I2	Sequence number of last volume. Duplicates field 93-94.
99-100	I2	Sequence number of the volume containing this record.
101-104	I4	Sequence number of the first file on this volume as counted over the volume group, omitting volume directories.
105-108	I4	Logical volume number. Always 1 for Scrounge.
109-112	I4	Number of this logical volume. Always 1 for Scrounge.
113-120	A8*	Creation date of volume set as YYYYMMDD.
121-128	A8*	Creation time as HHMMSSXX where XX= hundredths of seconds.
129-140	A12*	Country of origin: 'USA'
141-148	A8*	Agency of origin: 'NASAGSFC'
149-160	A12*	Originating Computer Center: 'LAS'

Table 11 (continued)

Bytes	Format	Description
161-164	I4*	Number of file pointers in the volume directory.
165-168	I4*	Number of records in the volume directory. The value is one greater than field 161-164 in LAS.
169-260		unused, reserved for LGSOWG expansion.
261-360		unused, available for local use.

* The indicated fields are not used for a null (last) volume descriptor.

Formats:

RI - A four byte integer correct for IBM systems. The integer is byte reversed on a VAX or PDP computer.

An - n ASCII characters.

In - n ASCII numeric characters representing an integer value.

B - a one byte integer regarded as unsigned.

Table 12

Source of Information: Reference 1.

Individual Cases:

- A: Pointer to HAAT label file
- B: Pointer to HAAT data file
- C: Pointer to Image label file
- D: Pointer to Image data file

Byte	Format	Description
1-4	RI	Contains the record number of this record within the Volume directory. The first file pointer is two, the next is three, etc.
5	B	Record code 333 octal
6	B	Record code 300 octal
7	B	Subtype code 022 octal
8	B	Subsubtype code 022 octal
9-12	RI	Length of this record, 360 decimal.
13-16	A4	Contains 'A' to indicate ASCII code.
17-20	I4	Sequence number of the file referenced by this pointer. Files are counted over the volume group omitting the volume directories from the count.
21-36	A16	File identification. For a label file, the value is 'DDR'. For a data file, the file identification is copied from the corresponding label field (see FTYPE in Table 14).
37-64	A28	A description of the file. The string is: A,B,or C: 'ASCII AND BINARY DATA' D: 'CELLULAR DATA /OR IMAGE DATA'
65-68	I4	An abbreviation for preceding field. It is: A,B,or C: 'ABD' D: 'COID'
69-96	A28	Contains the phrase "MIXED BINARY AND ASCII".
97-100	A4	Contains the code "MBAA" which abbreviates 69-96
101-108	I8	Number of records in the referenced file. Namely, A: blank, number of records variable. B: '32' C: blank, number of records variable. D: For AT, '1448'. For PT, '1492'
109-116	I8	The length in bytes of the file description records. In LAS, a uniform record length within a file is used. The length is: A: 512 bytes B: 6656 bytes C: 512 bytes D: 26624 for AT and 28672 for PT data.
117-124	I8	Largest record in the file, not counting descriptor. Same value as field 109-116

Table 12 (continued)

Bytes	Format	Description
125-136	A12	Contains the phrase "FIXED LENGTH"
137-140	A4	Contains an abbreviation for 125-136. In the absence of a LGSOWG standard, LAS codes "FB "
141-142	I2	Number of the physical volume on which the file starts.
143-144	I2	Number of the physical volume on which the file ends. N.B. LAS files begin and end on the same volume.
145-152	I8	First record number of the file portion on this volume. Always has the value 1 for LAS.
153-260		unused, reserved for LGSOWG expansion
261-360		unused, reserved for local use

Formats:

RI - A four byte integer correct for IBM systems. The integer is byte reversed on a VAX or PDP computer.

An - n ASCII characters.

In - n ASCII numeric characters representing an integer value.

B - a one byte integer regarded as unsigned.

45-48	I4	Number of this file in the logical volume. Counted from the first volume without counting volume directories.
49-64	A16	File identification. Agrees with bytes 21-36 of the file pointer (Table 12).
65-68	A4	Contains the string 'NSEQ'
69-76	I8	unused, set to zero.
77-80	I8	unused, set to zero.
84	A4	Type code locator. Values are: Case A: "FTYP" Cases B and C: "NTYP"
85-92	I8	contains the value 33 decimal
93-96	I4	contains the value 8 decimal.
97-100	A4	contains the string "NLGT"
101-108	I8	unused, blank
109-112	I4	unused, blank

RI - A four byte integer correct for IBM systems. The integer is byte reversed on a VAX or PDP computer.

An - n ASCII characters.

In - n ASCII numeric characters representing an integer value.

B - a one byte integer regarded as unsigned.

TABLE 14
CONTENTS OF DDR RECORD

<u>BYTES</u>	<u>VAX FORMAT</u>	<u>SHORT NAME</u>	<u>DESCRIPTION</u>
1-20	A20	LABKEY	LOCATES DDR IN DISK FILE
21-24	---	----	RESERVED
25-28	A4	SEQNO	THIS NUMBER WRITTEN AS AN ASCII STRING SEQUENCES THE LABEL RECORDS BELONGING TO THIS IMAGE OR LABEL KEY.
29-32	I4	LASTNO	THIS INTEGER RECORDS THE LAST SEQNO USED IN EXTENDING THE SEQUENCE OF LABEL RECORDS
33-40	A8	LTYPE	THIS FIELD SPECIFIES 'DDR '
41-140	A100	TAE	THE FULL TAE NAME OF THE DATA FILE
141-148	A8	SOURCE	AN ASCII STRING WHICH GIVES THE SATELLITE AND INSTRUMENT THAT YIELDED THE ORIGINAL DATA. THE VALUES OF THIS FIELD ARE CONFIGURATION MANAGEMENT ITEMS AND THE LAST TWO CHARACTERS MUST AGREE WITH THE SATELLITE AND INSTRUMENT ATTRIBUTES IN THE TAE CATALOG. FOR LANDSAT-D TM AND MSS INSTRUMENTS THE VALUES ARE: 'LNDST-DT' AND 'LNDST-DM'
149-168	A20	FILE--CREATION--TIME	THIS FIELD RECORDS THE DATE AND TIME WHEN THIS DDR AND, BY ASSUMPTION, THE IMAGE WERE CREATED.
169-176	A8	FTYPE	THIS FIELD NAMES THE TYPE OF THE CORRESPONDING FILE. E.G. 'IMAGE'. THIS FIELD IS A CONFIGURATION MANAGEMENT ITEM BECAUSE FUTURE TAE VERSION MAY VERIFY THIS FIELD AGAINST THE PROCESS PDF.
177-178	---	----	RESERVED
179-180	L2	PVALID	A TRUE VALUE INDICATES THAT THE PIXEL "LOWVAL" AND "HIVAL" HAVE BEEN SET TO REASONABLE VALUES.

Table 14 (continued)

<u>BYTES</u>	<u>VAX FORMAT</u>	<u>SHORT NAME</u>	<u>DESCRIPTION</u>
181-190	---	----	RESERVED
191-192	12	BAND	BAND NUMBER OF IMAGE
193-194	12	ICOORD	INDICATES THE STATUS OF IMAGE LOCATION VARIABLES; PFIRST, PDELTA, LFIRST, AND LDELTA. A VALUE 0 IMPLIES VARIABLES NOT SET; A VALUE 1 IMPLIES THE VARIABLES LOCATE THIS IMAGE IN THE ORIGINAL SCENE.
195-196	A2	DCODE	A TWO CHARACTER CODE FOR THE PIXEL DATA TYPE. THE TYPES ARE: IN: SIGNED INTEGER BI: UNSIGNED INTEGER FL: FLOATING POINT CM: COMPLEX
			THESE TYPES ARE STRICT CONFIGURATION MANAGEMENT ITEMS, IN ADDITION, ONLY A RESTRICTIVE NUMBER OF COMBINATIONS ARE ALLOWED IN CONJUNCTION WITH THE VARIABLES BCOUNT. THE ALLOWED COMBINATIONS ARE: IN: BCOUNT = 2,4 BI: BCOUNT = 1 FL: BCOUNT = 4 CM: BCOUNT = 8
217-236	A20	SCENE	IDENTIFICATION OF SCENE
237-280	---	----	RESERVED
281-284	14	BCOUNT	NUMBER OF BYTES PER PIXEL VALUE SEE RESTRICTIONS ON DCODE.
285-288	R4	PFIRST	THE LOCATION OF THE FIRST PIXEL OF EACH LINE OF THIS IMAGE IN THE PIXEL COORDINATES OF THE ORIGINAL IMAGE. THE REAL VARIABLE ACCOMMODATES FRACTIONAL IMAGE SHIFTS.

Table 14 (continued)

<u>BYTES</u>	<u>VAX FORMAT</u>	<u>SHORT NAME</u>	<u>DESCRIPTION</u>
289-292	R4	PDELTA	THE SPACING BETWEEN THE PIXELS OF THIS IMAGE RELATIVE TO THE PIXEL SPACING IN THE ORIGINAL IMAGE. THE REAL VARIABLE TYPE ALLOWS FRACTIONAL SPACINGS RESULTING FROM ZOOM EFFECTS.
293-296	I4	NP	NUMBER OF PIXELS PER LINE
297-304	---	----	RESERVED
305-308	R4	LFIRST	THE LOCATION OF THE FIRST LINE OF THIS IMAGE IN THE PIXEL COORDINATES OF THE ORIGINAL IMAGE. THE REAL VARIABLE ACCOMMODATES FRACTIONAL IMAGE SHIFTS.
309-312	R4	LDELTA	THE SPACING BETWEEN THE LINES OF THIS IMAGE RELATIVE TO THE LINE SPACING IN THE ORIGINAL IMAGE. THE REAL VARIABLE TYPE ALLOWS FRACTIONAL SPACINGS RESULTING FROM ZOOM EFFECTS.
313-316	I4	NL	NUMBER OF PIXELS
317-424	---	----	RESERVED
425-512	---	----	UNUSED

FORMATS:

- AN ASCII STRING OF N CHARACTERS, LEFT JUSTIFIED WITH BLANK FILL.
- L2 VAX 2 BYTE LOGICAL VARIABLE
- I2 VAX INTEGER WORD
- I4 VAX INTEGER LONG WORD
- R4 VAX FLOATING POINT LONG WORD

25-28	A4	SEQNO	THIS NUMBER WRITTEN AS AN ASCII STRING SEQUENCES THE LABEL RECORDS BELONGING TO THIS IMAGE OR LABEL KEY.
29-32	I4	RECLEN	THIS INTEGER GIVES THE LENGTH OF THE VARIABLE SIZED HISTORY TEXT.
33-40	A8	LTYPE	THIS FIELD SPECIFIES 'DDR' '
40-512	A		A TEXT STRING THAT BEGINS WITH THE DATE, TIME, AND LAS SOFTWARE MODULE NAME AND CONTINUES WITH A PARTICULAR MESSAGE CONCERNING THE DATA SET PROCESSING HISTORY. THE HISTORY TEXT MAY SPAN LABEL RECORDS AS INDICATED BY THE RECLEN PARAMETER.

FORMATS:

AN ASCII STRING OF N CHARACTERS, LEFT JUSTIFIED WITH BLANK FILL.
